

NUTRITION TIPS

Congestive Heart Failure

If you're living with congestive heart failure, it is important to **limit the amount of sodium** you consume. Sodium causes your body to hold water, and when your body holds too much water, it can lead to shortness of breath and swelling. You can prevent these symptoms by cutting down on foods with high sodium content and by limiting the amount of salt you use in seasoning.

Reducing Sodium In Your Diet

- ✓ Limit sodium you get from food and drink to 2,300 milligrams per day.
- ✓ Select foods with 140 milligrams of sodium or less per serving.
- ✓ Fresh meats are lower in sodium than processed meats, such as bacon, sausage and hot dogs.
- ✓ Choose fresh and frozen fruits and vegetables without added sauces, as they are naturally low in sodium.
- ✓ Instead of salt, try seasonings that are low in sodium such as cardamon, coriander, cumin, paprika, rosemary or fresh herbs.

ECHN offers outpatient nutritional counseling at Manchester Memorial Hospital – in person or via telehealth. A referral is needed from your primary care provider or specialist.

Call **860.646.1222 x 2112** to learn more. If you already received a referral, call **860.872.5150** to schedule an appointment.
